

CROWS

CYBER RESILIENCY OFFICE FOR WEAPON SYSTEMS

Department of the Air Force
Systems Security Engineering Cyber Guidebook

Katie Whatmore, ASB Chief

Cyber Resiliency Office for Weapon Systems

CROWS@US.AF.MIL

Approved for Public Release;
Distribution Unlimited: Case 2023-0415

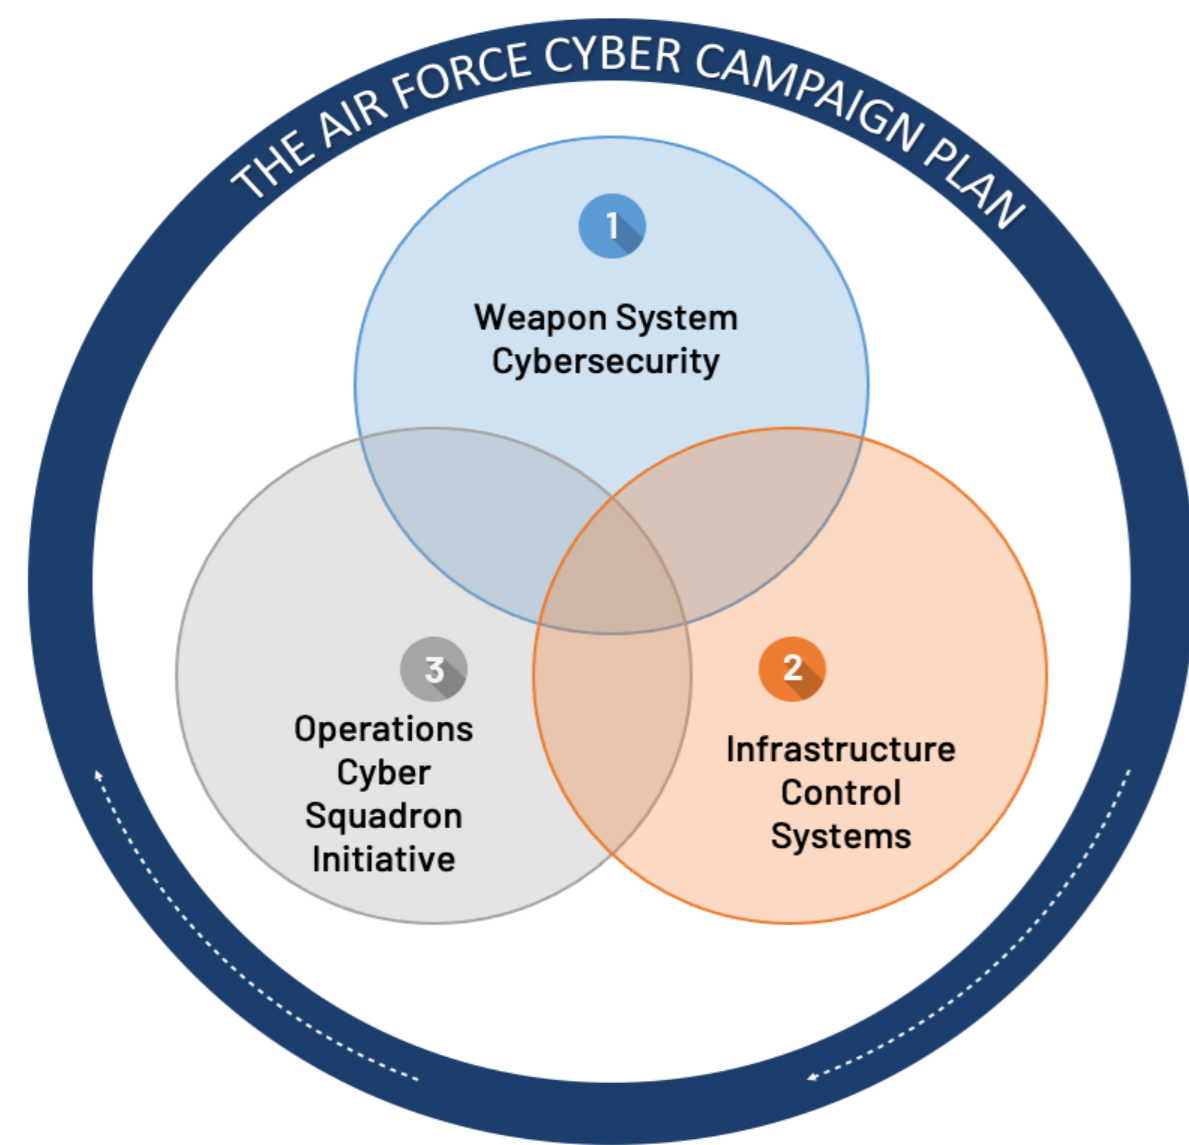

● A Brief History of CROWS

“The task force will **diagnose the extent of the cyber threat and the vulnerabilities** that currently impact our core missions, will plan to develop a risk management plan that will allow the Air Force to fly, fight and win in a cyber-contested environment, and **will recommend investment priorities to the SECAF and CSAF** for how best to address the cybersecurity challenges. - Lt Gen Bill Bender, USAF CIO, 2015

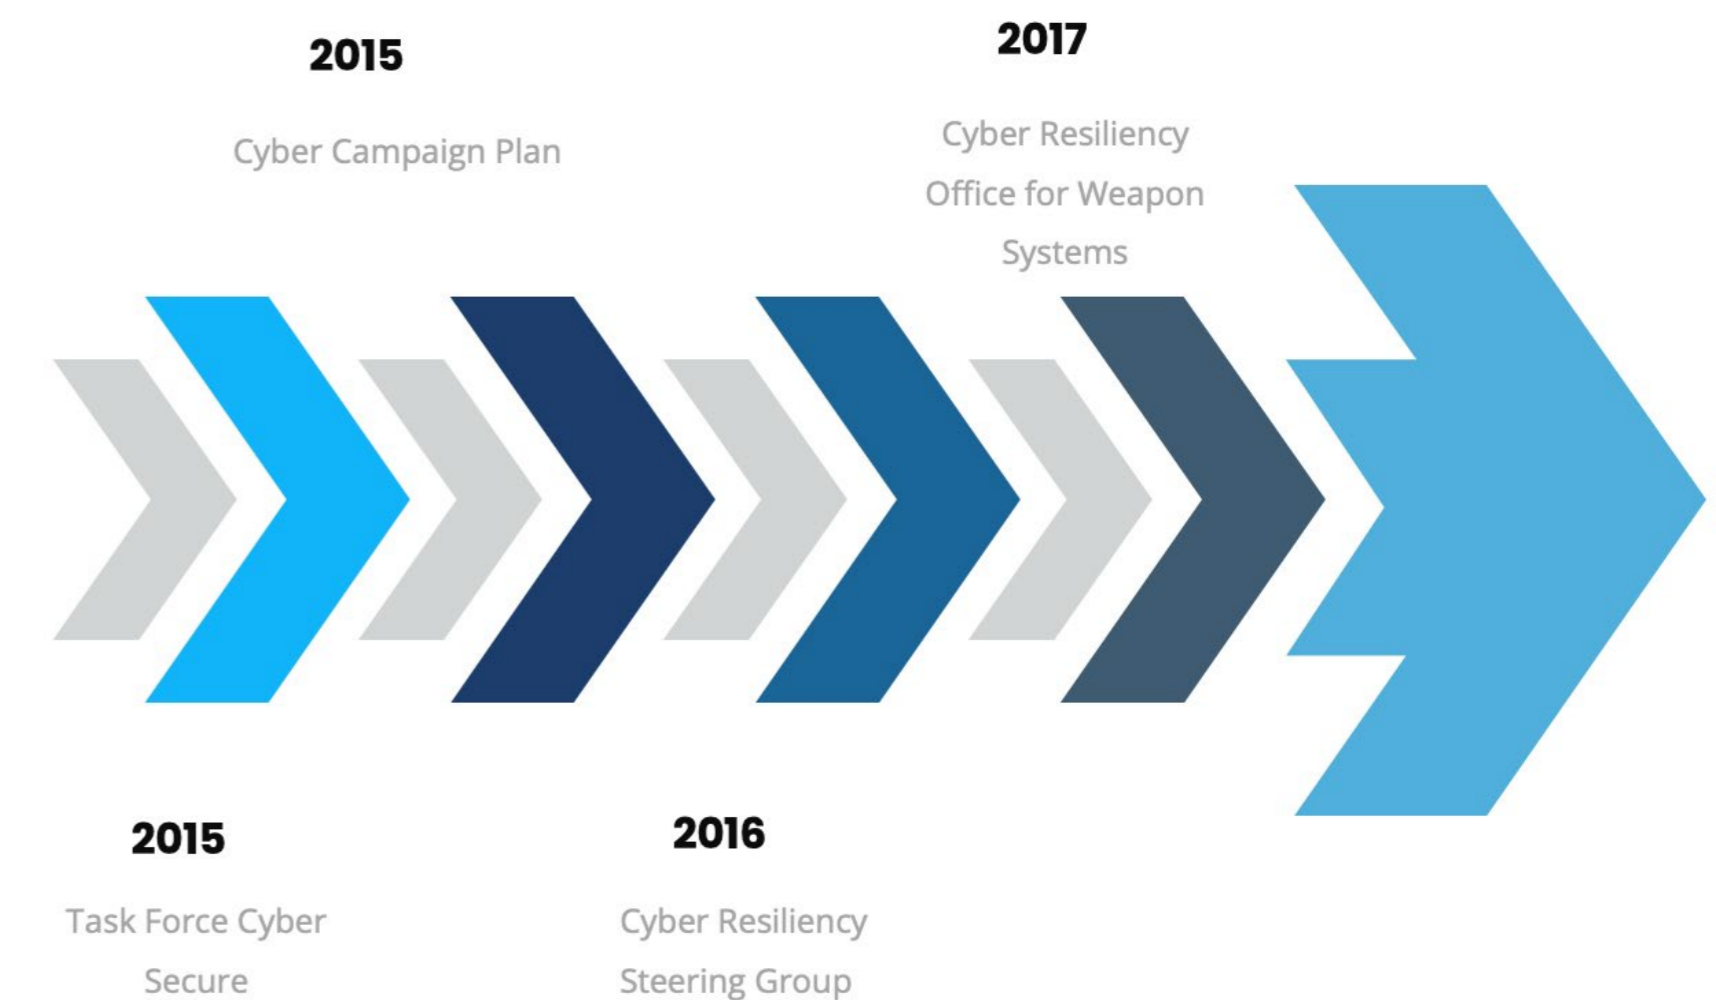

Cyber Campaign Plan

Forged out of 2015’s Task Force Cyber Secure, an initiative enacted by then Air Force Chief of Staff Gen. Mark A. Welsh, the Cyber Campaign Plan was developed to synchronize cyber security efforts across the Air Force enterprise to improve the security of information and warfighting systems.

- Acquisition – Weapon System Cyber Resiliency led by the Secretary of the Air Force for Acquisition, Technology, and Logistics (SAF/AQ)
- Infrastructure – Industrial Control Systems and Supervisory Control and Data Acquisition (ICS/SCADA)
- Operations – Communication Squadron Initiative led by the SAF/Chief Information Officer

CROWS TIMELINE

MISSION

INCREASE THE CYBER RESILIENCY OF AIR AND SPACE FORCE WEAPON SYSTEMS TO MAINTAIN MISSION EFFECTIVE CAPABILITY UNDER ADVERSE CONDITIONS

GOALS

BAKE CYBER RESILIENCY INTO NEW WEAPON SYSTEMS AND MITIGATE CRITICAL VULNERABILITIES IN FIELDED WEAPON SYSTEMS

VISION

CYBER RESILIENCY EMBEDDED INTO AIR AND SPACE FORCE WEAPON SYSTEMS AND INGRAINED IN DEPARTMENT OF THE AIR FORCE CULTURE

• Systems Security Engineering

Policy and Guidance

Current policy is diverse and comes from many governing authorities

These policies are executed through PP and SSE

SSECG V5.0 Summary

How to use this Guidebook

The SSECG Guidebook's presentation order mirrors its DAF System Security Engineering Cyber Process Workflow chart. Each process is delineated by existing DoD, DAF & Government directives or standards. Each process is directly linked to its respective WBS Tasks or Sub-tasks tied to their suggested contractual language.

1 The SSE Cyber Workflow chart shows the order of all activities and decision points throughout a system's development.

3 Many references are attached as Appendices to provide more detail on how to accomplish each activity.

2 The WBS then breaks down each block on the Workflow chart into individual activities.

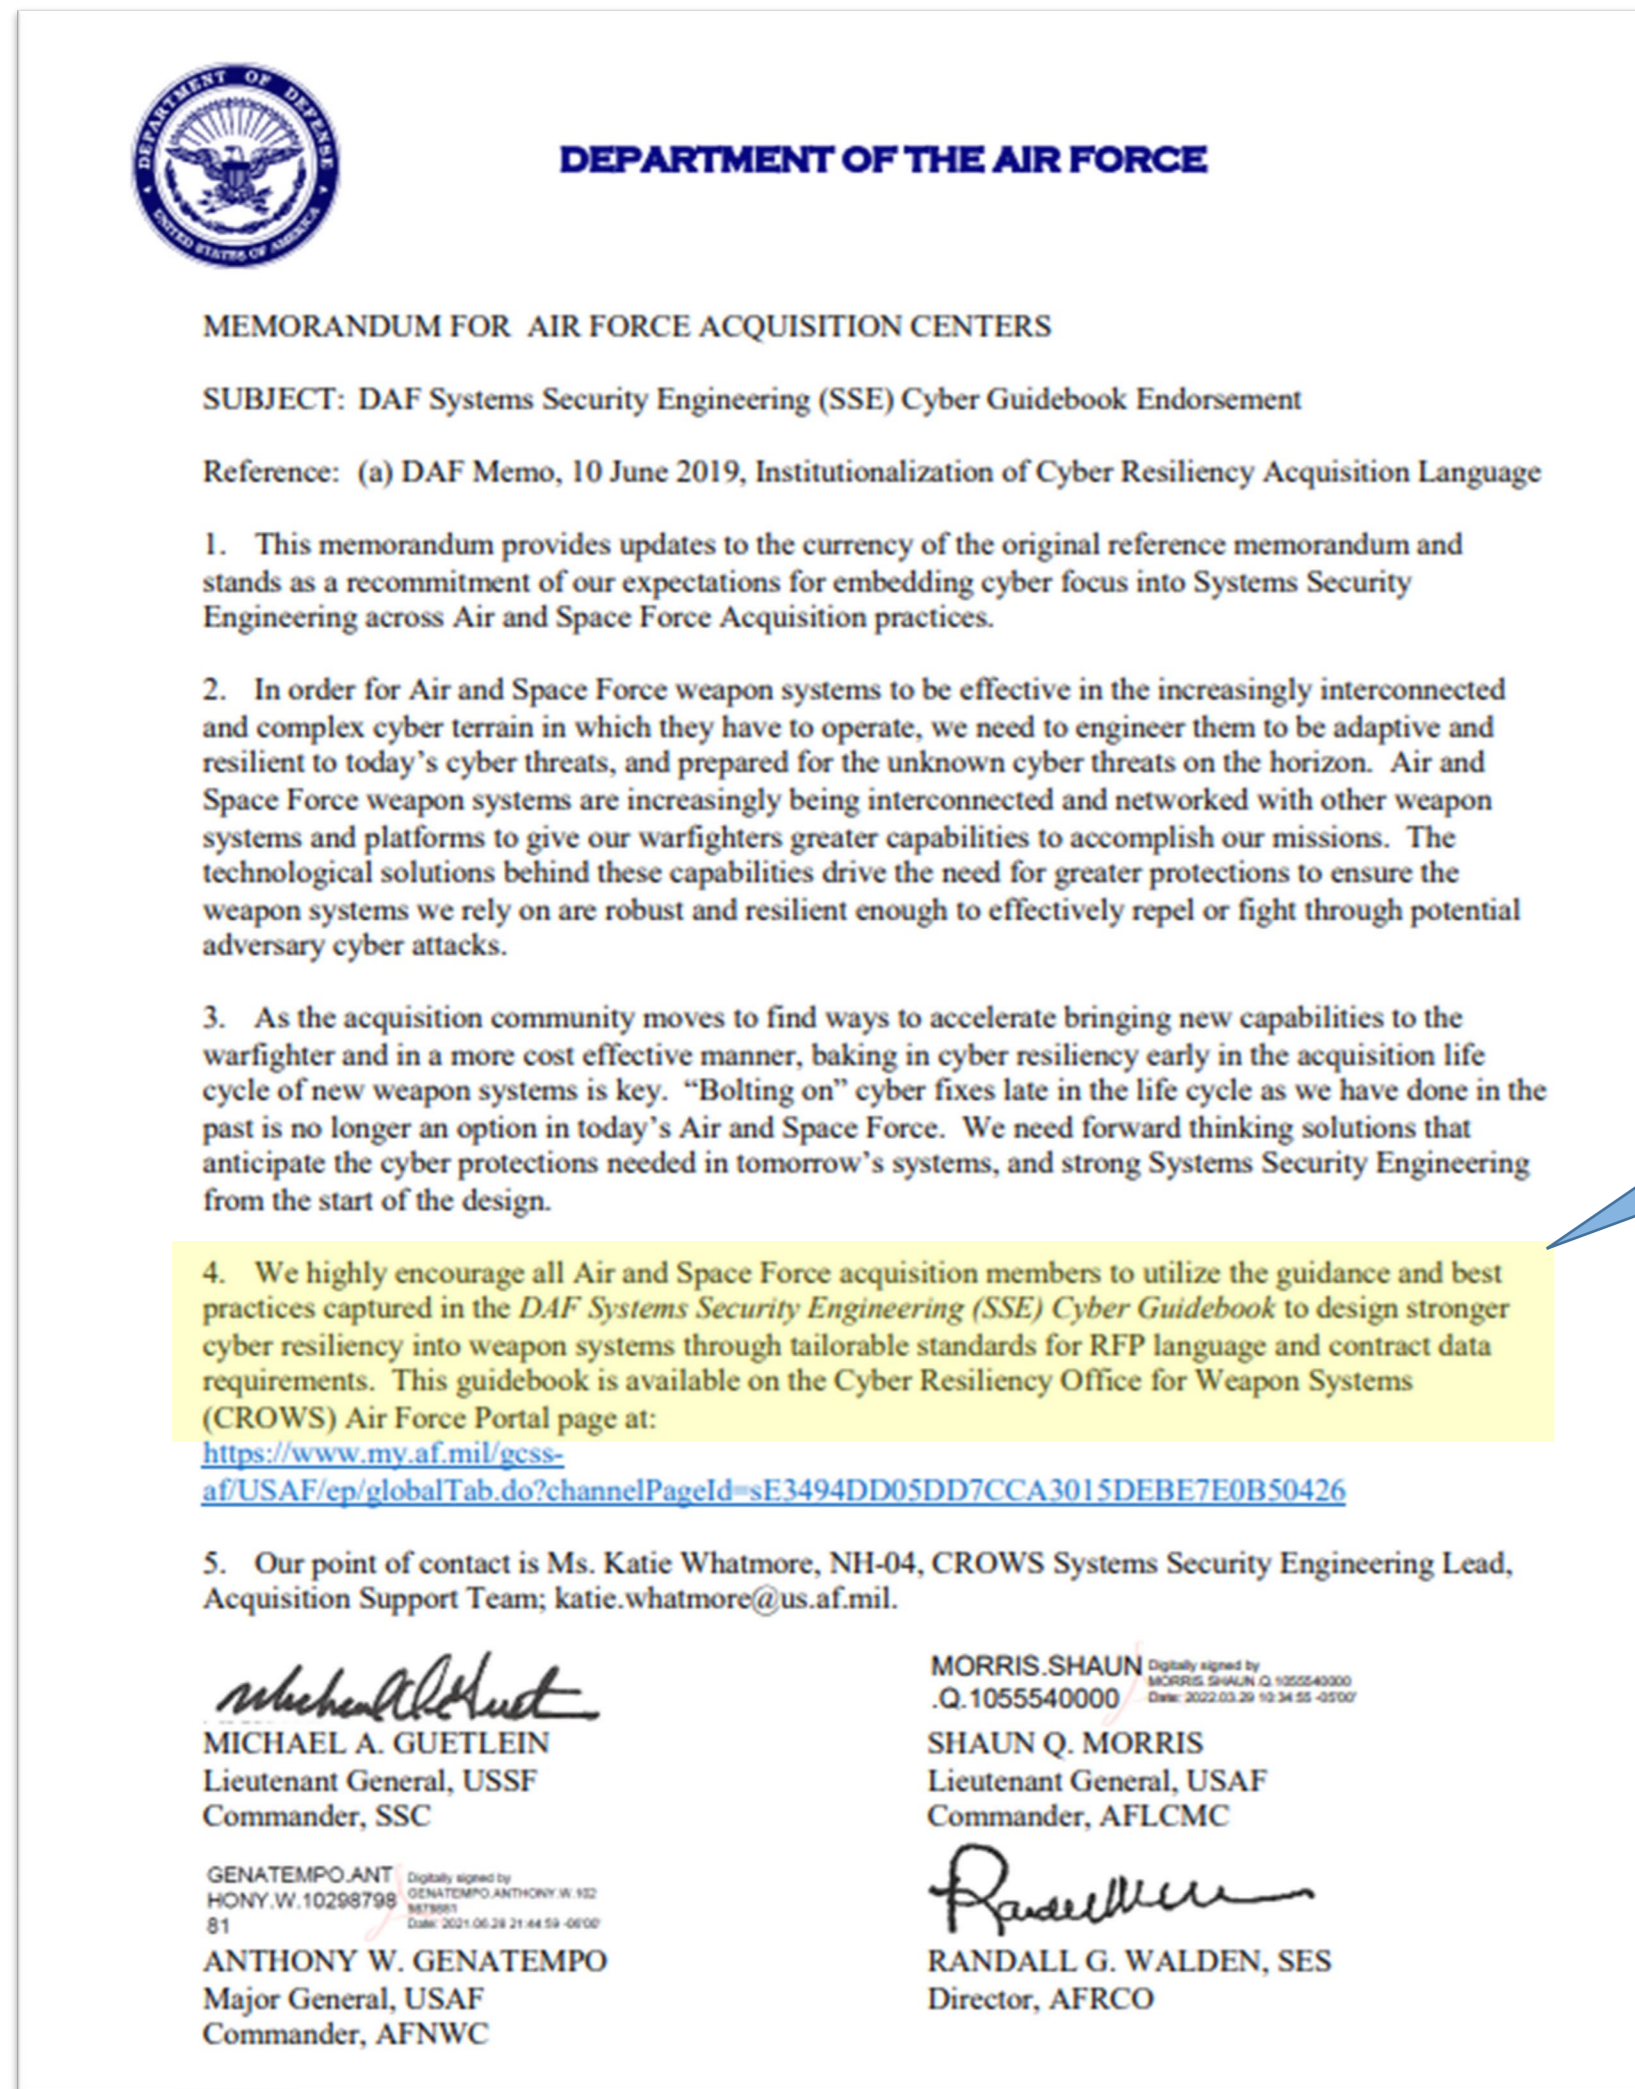

WBS Activity	Activity Description	ARTIFACTS PRODUCED	REFERENCES
1.1.1.1	Develop the System Security Engineering (SSE) Plan (SSERP) for the system. The SSERP is a high-level document that describes the system's security requirements, the SSE process, and the roles and responsibilities of the system's stakeholders. It is the foundation for the system's security engineering and is used to guide the development of the system's security architecture, the system's security testing, and the system's security deployment.	SSERP, System Security Architecture (SSA), System Security Requirements (SSR), System Security Test Plan (SSTP), System Security Test Results (SSTR), System Security Deployment Plan (SSDP), System Security Deployment Results (SSDR)	DoDI 5000.83, AFI 16-1401, DoD Cybersecurity Test and Evaluation Guidebook
1.1.1.2	Develop the System Security Architecture (SSA) for the system. The SSA is a high-level document that describes the system's security architecture, including the system's security requirements, the system's security architecture, and the system's security testing. It is the foundation for the system's security engineering and is used to guide the development of the system's security architecture, the system's security testing, and the system's security deployment.	SSA, System Security Requirements (SSR), System Security Test Plan (SSTP), System Security Test Results (SSTR), System Security Deployment Plan (SSDP), System Security Deployment Results (SSDR)	DoDI 5000.83, AFI 16-1401, DoD Cybersecurity Test and Evaluation Guidebook
1.1.1.3	Develop the System Security Requirements (SSR) for the system. The SSR is a high-level document that describes the system's security requirements, including the system's security requirements, the system's security architecture, and the system's security testing. It is the foundation for the system's security engineering and is used to guide the development of the system's security architecture, the system's security testing, and the system's security deployment.	SSR, System Security Architecture (SSA), System Security Test Plan (SSTP), System Security Test Results (SSTR), System Security Deployment Plan (SSDP), System Security Deployment Results (SSDR)	DoDI 5000.83, AFI 16-1401, DoD Cybersecurity Test and Evaluation Guidebook
1.1.1.4	Develop the System Security Test Plan (SSTP) for the system. The SSTP is a high-level document that describes the system's security testing, including the system's security testing, the system's security architecture, and the system's security testing. It is the foundation for the system's security engineering and is used to guide the development of the system's security architecture, the system's security testing, and the system's security deployment.	SSTP, System Security Architecture (SSA), System Security Requirements (SSR), System Security Test Results (SSTR), System Security Deployment Plan (SSDP), System Security Deployment Results (SSDR)	DoDI 5000.83, AFI 16-1401, DoD Cybersecurity Test and Evaluation Guidebook
1.1.1.5	Develop the System Security Test Results (SSTR) for the system. The SSTR is a high-level document that describes the system's security testing results, including the system's security testing results, the system's security architecture, and the system's security testing. It is the foundation for the system's security engineering and is used to guide the development of the system's security architecture, the system's security testing, and the system's security deployment.	SSTR, System Security Architecture (SSA), System Security Requirements (SSR), System Security Test Plan (SSTP), System Security Deployment Plan (SSDP), System Security Deployment Results (SSDR)	DoDI 5000.83, AFI 16-1401, DoD Cybersecurity Test and Evaluation Guidebook
1.1.1.6	Develop the System Security Deployment Plan (SSDP) for the system. The SSDP is a high-level document that describes the system's security deployment, including the system's security deployment, the system's security architecture, and the system's security testing. It is the foundation for the system's security engineering and is used to guide the development of the system's security architecture, the system's security testing, and the system's security deployment.	SSDP, System Security Architecture (SSA), System Security Requirements (SSR), System Security Test Plan (SSTP), System Security Test Results (SSTR), System Security Deployment Results (SSDR)	DoDI 5000.83, AFI 16-1401, DoD Cybersecurity Test and Evaluation Guidebook
1.1.1.7	Develop the System Security Deployment Results (SSDR) for the system. The SSDR is a high-level document that describes the system's security deployment results, including the system's security deployment results, the system's security architecture, and the system's security testing. It is the foundation for the system's security engineering and is used to guide the development of the system's security architecture, the system's security testing, and the system's security deployment.	SSDR, System Security Architecture (SSA), System Security Requirements (SSR), System Security Test Plan (SSTP), System Security Test Results (SSTR), System Security Deployment Plan (SSDP)	DoDI 5000.83, AFI 16-1401, DoD Cybersecurity Test and Evaluation Guidebook

Content

- Main Body- SSE Cyber Process Guidebook
 - Executive Summary
 - Detailed Work Breakdown Structure in Section 4
 - Includes figures in Section 4 to help users link the SSE Workflow Process to the Acquisition Life Cycle phases
- Supplemental Appendices
 - Appendix A: DAF SSE Acquisition Guidebook
 - Appendix B: DAF Combined Process Guide for CPI/CC Identification
 - Appendix C: Functional Thread Analysis
 - Appendix D: Attack Path Analysis
 - Appendix E: Design Considerations
 - Appendix F: Relationship to Other Processes
 - Appendix G-J: Definitions, Acronyms, References, and Templates

Note: V5 is currently Distro D and still undergoing public release review

Memorandum & Endorsement

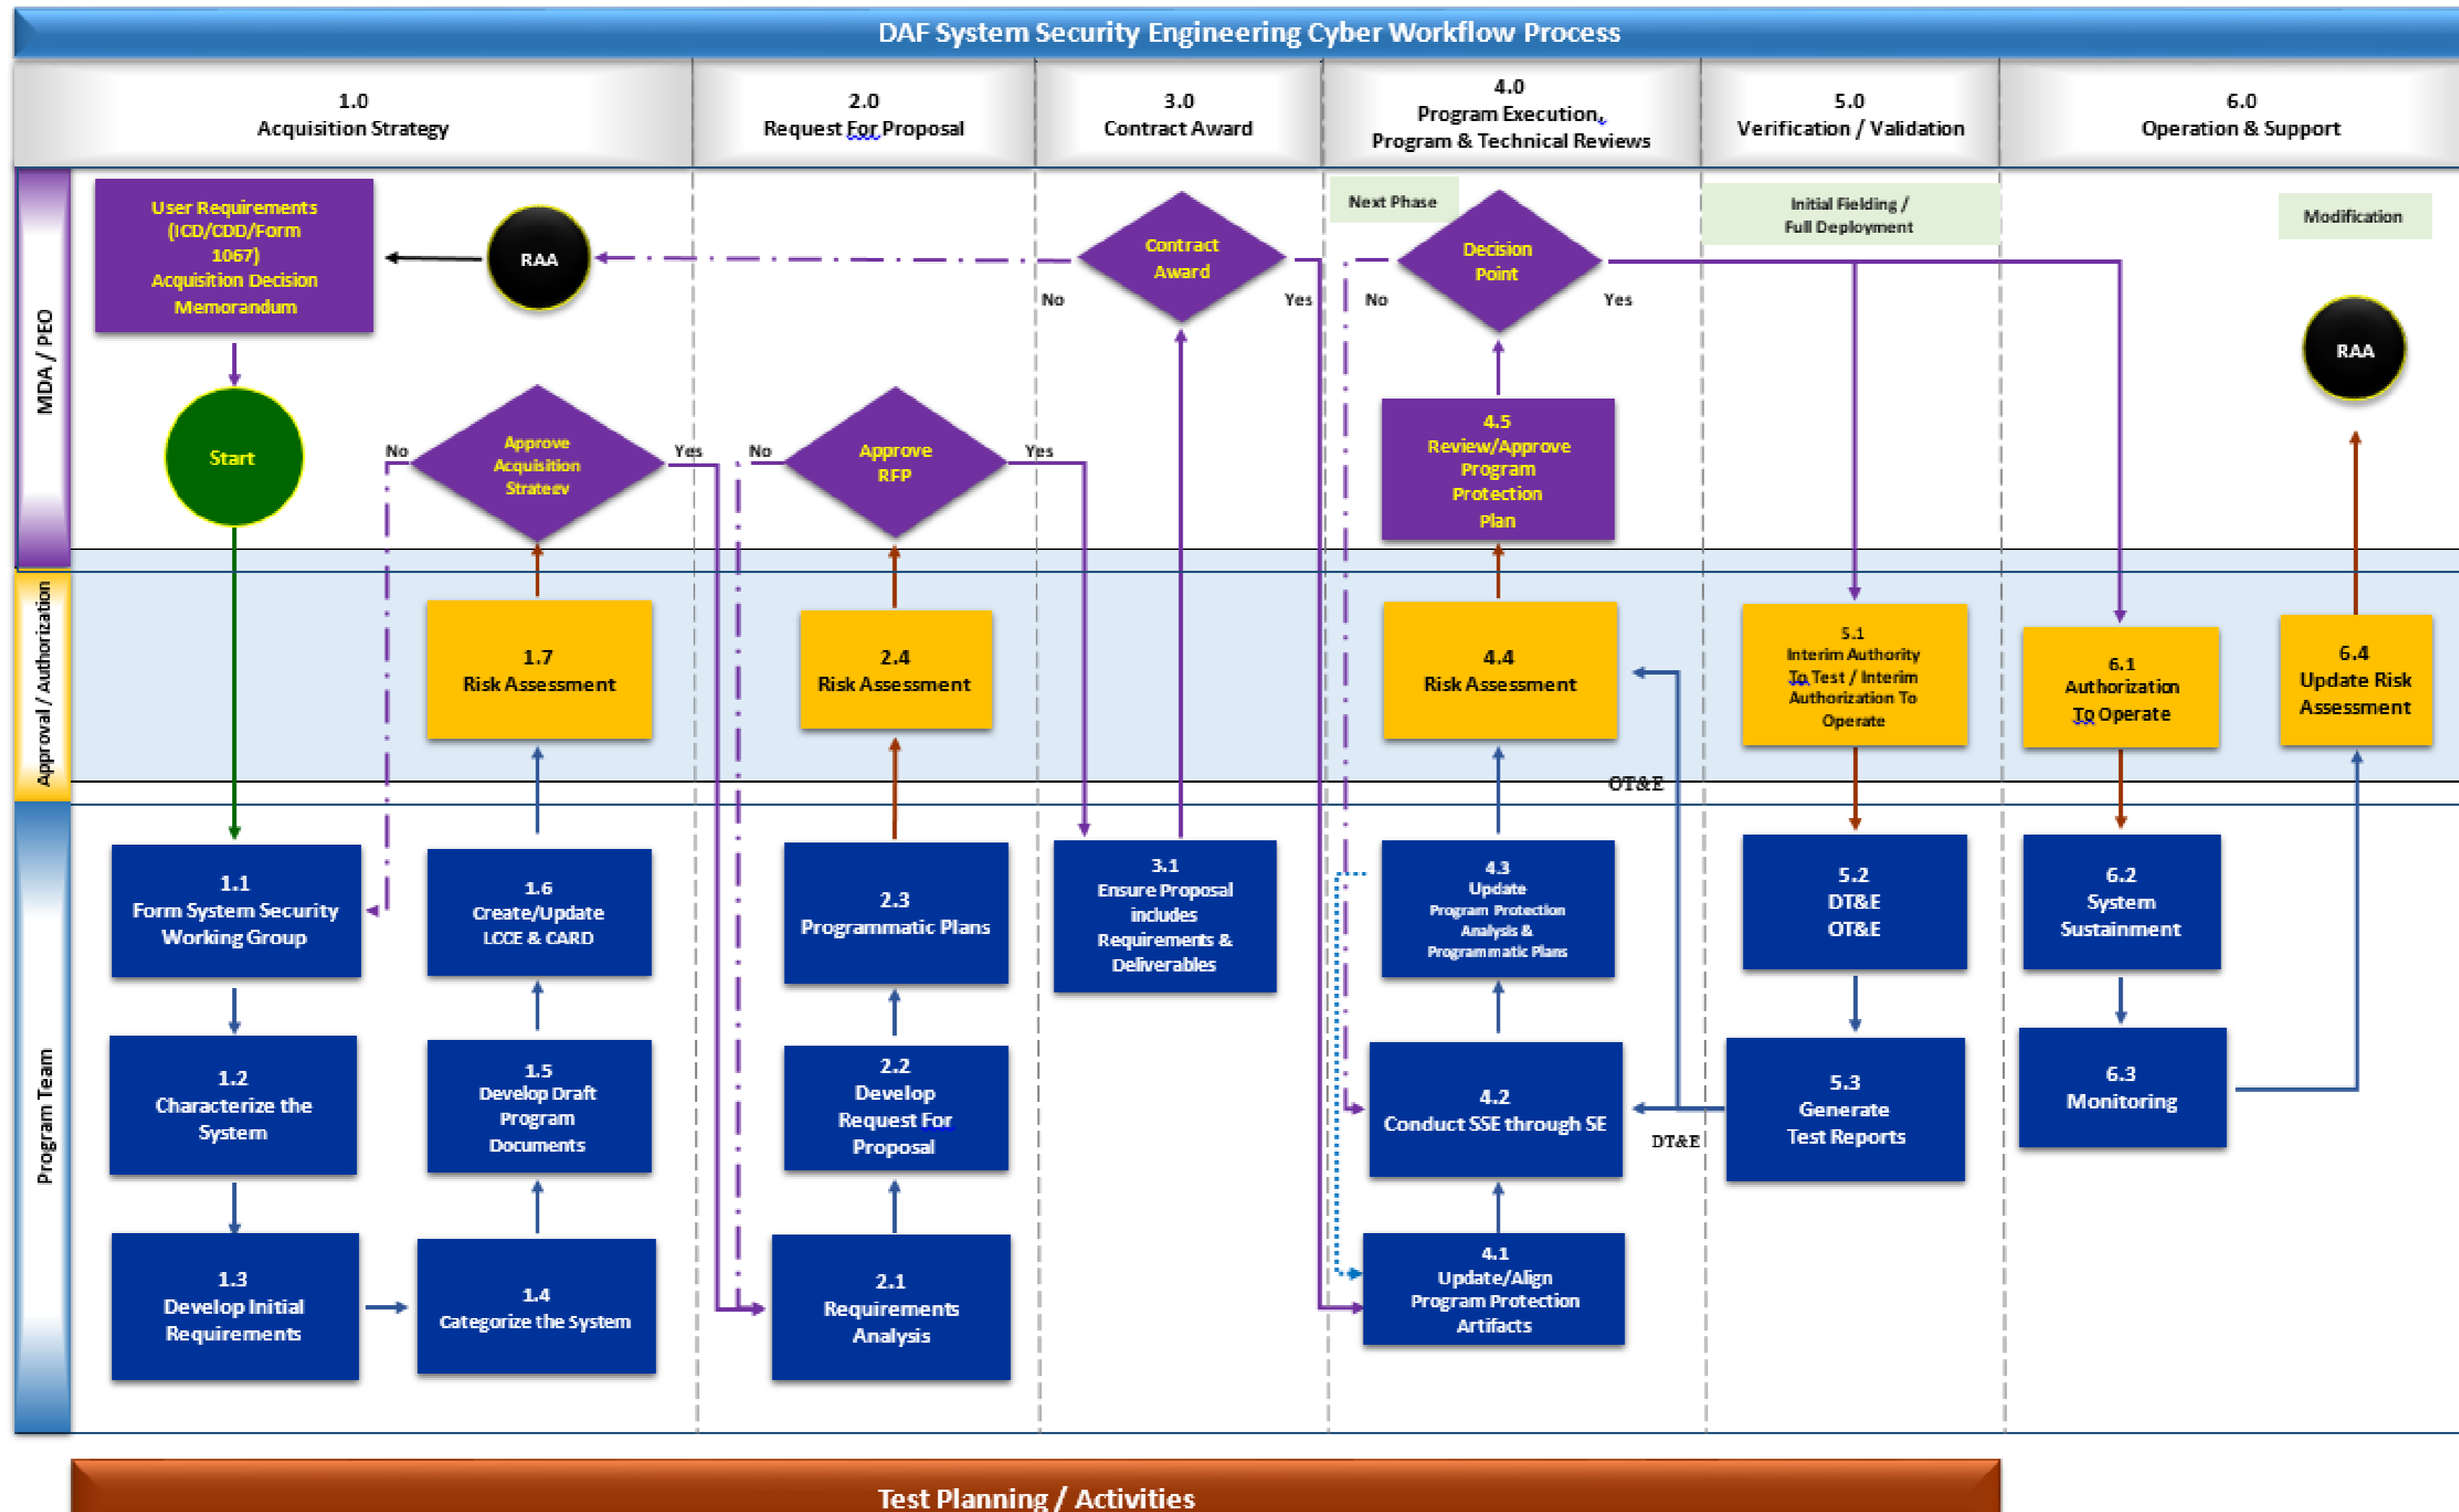

4. We highly encourage all Air and Space Force acquisition members to utilize the guidance and best practices captured in the DAF Systems Security Engineering (SSE) Cyber Guidebook to design stronger cyber resiliency into weapon systems through tailorable standards for RFP language and contract data requirements.

The need for this guidebook and its contents has been endorsed by the following organizations:

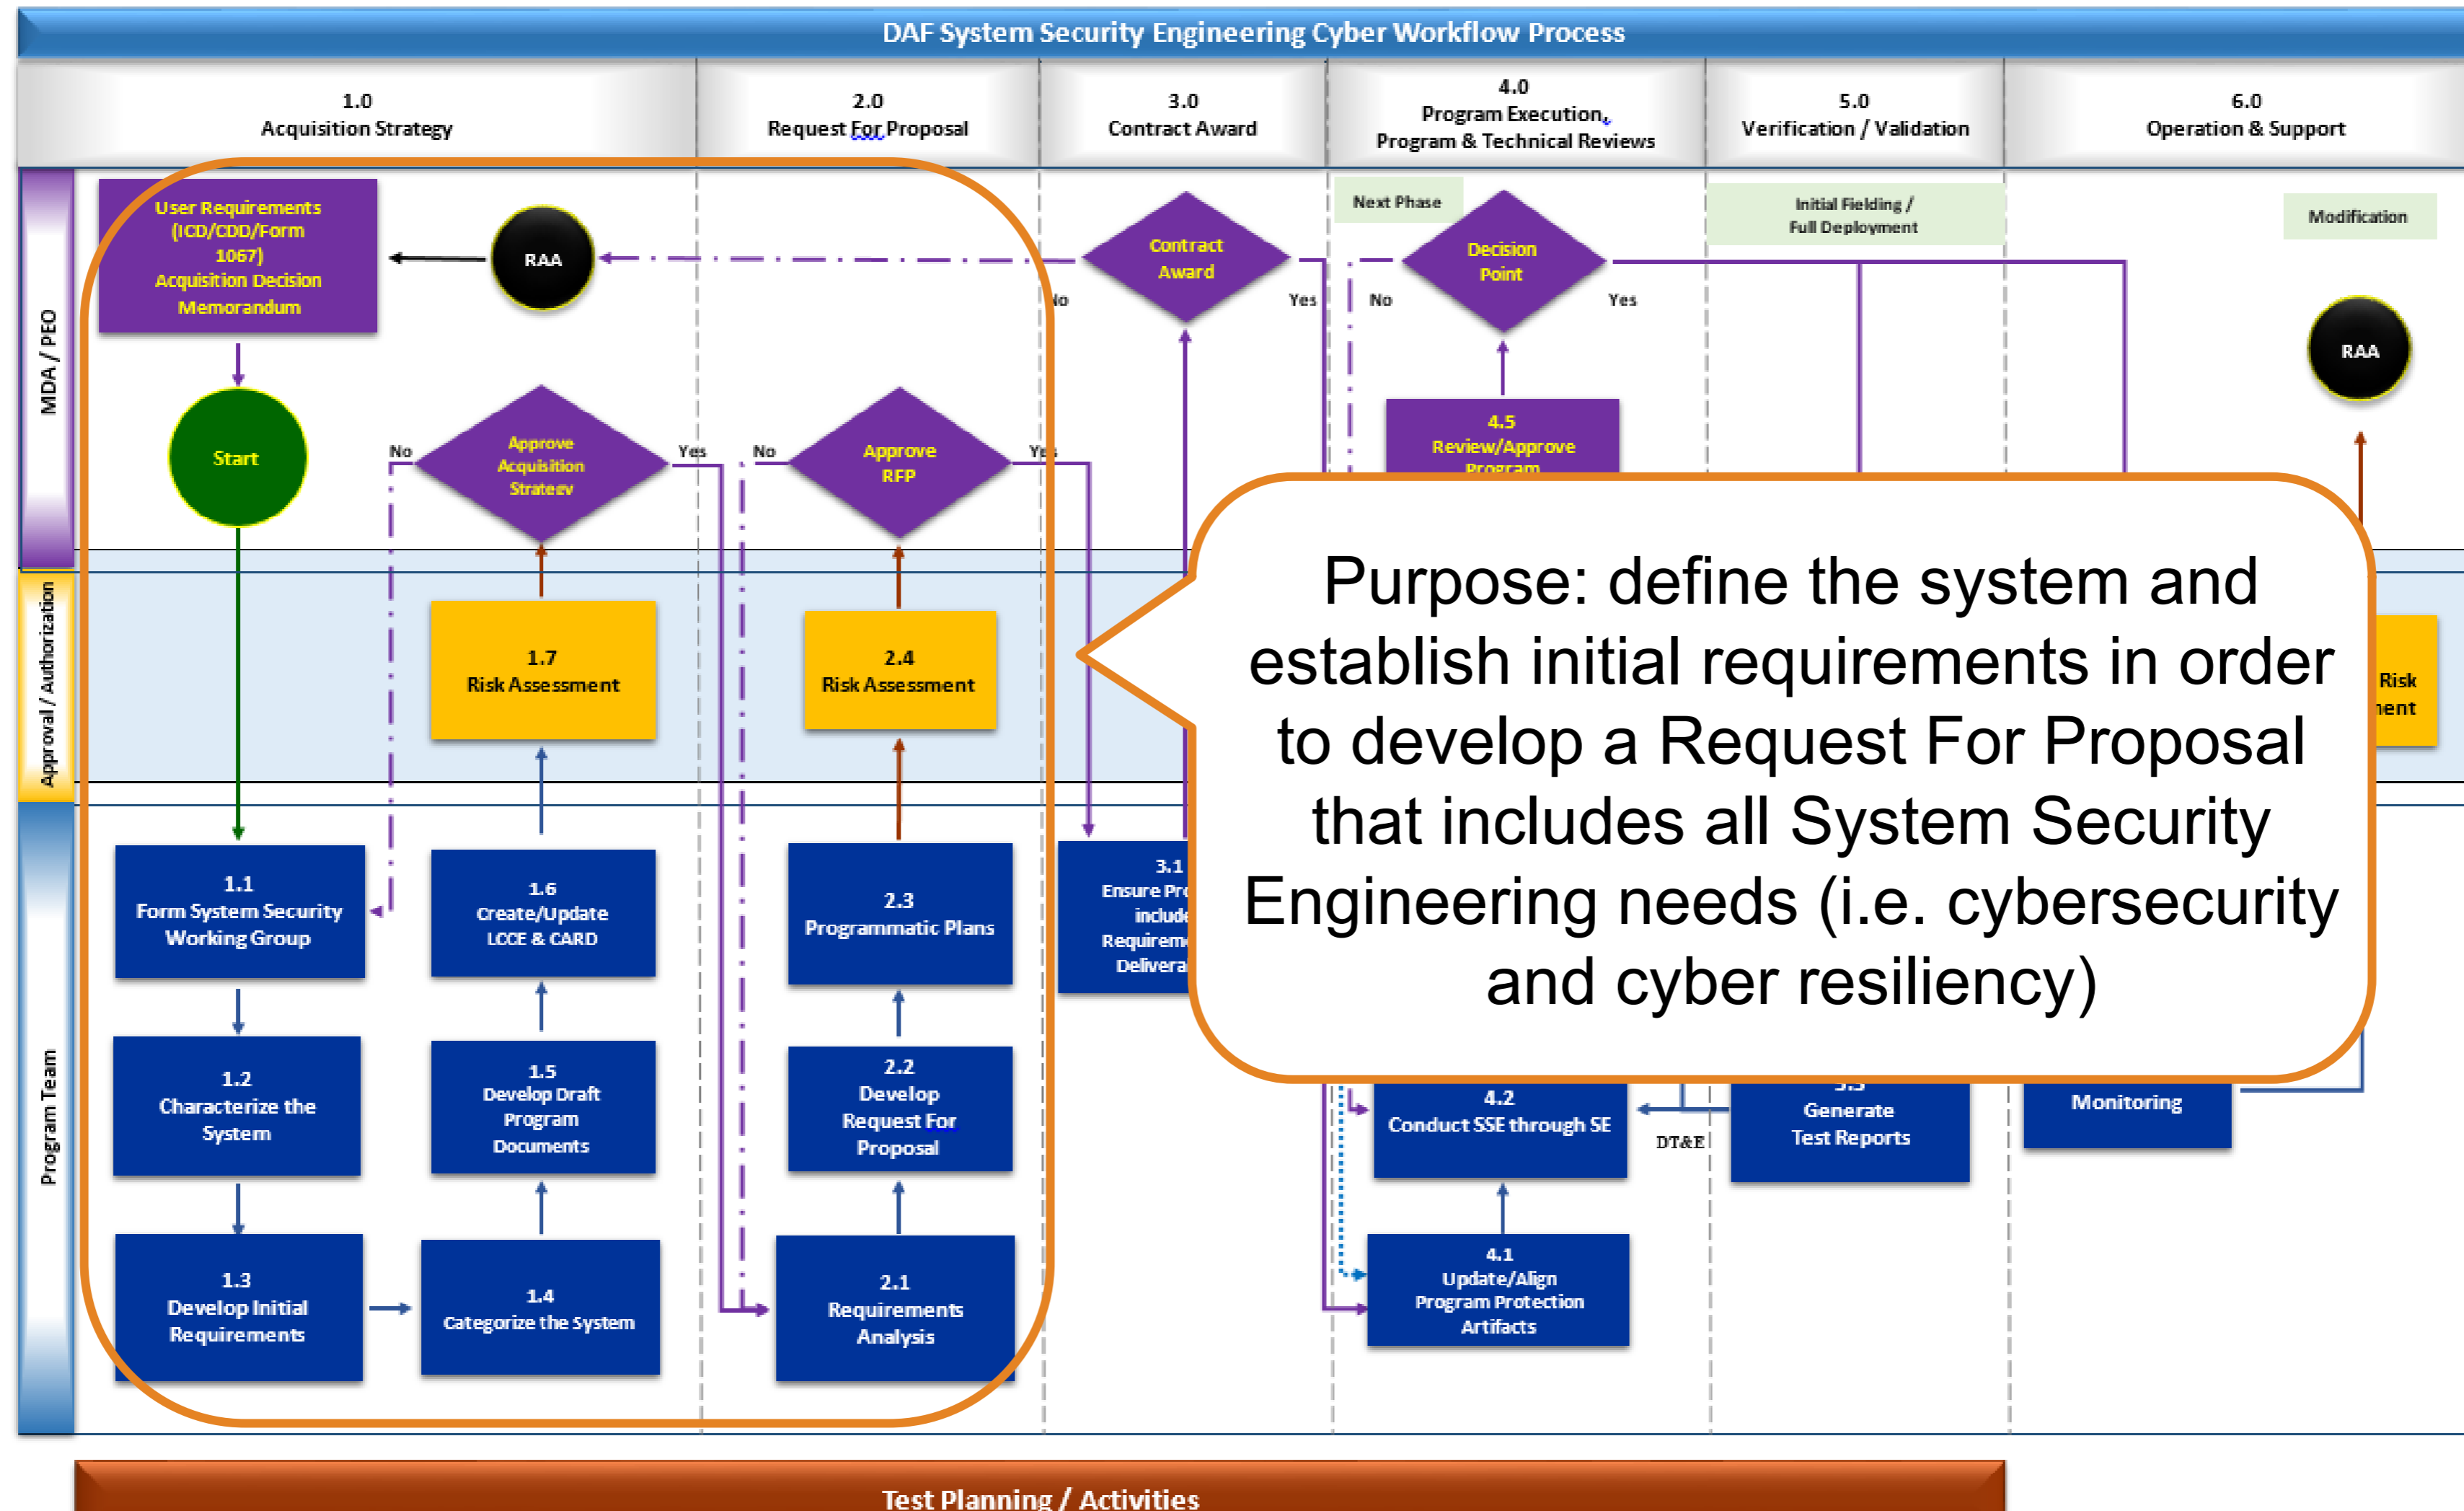

- United States Air Force Life Cycle Management Center
- United States Air Force Space and Missile Systems Center
- United States Air Force Nuclear Weapons Center
- United States Air Force Rapid Capabilities Office
- Naval Air Systems Command (NAVAIR) Cyber Warfare Department
- National Defense Industrial Association (NDIA) Systems Security Engineering Committee

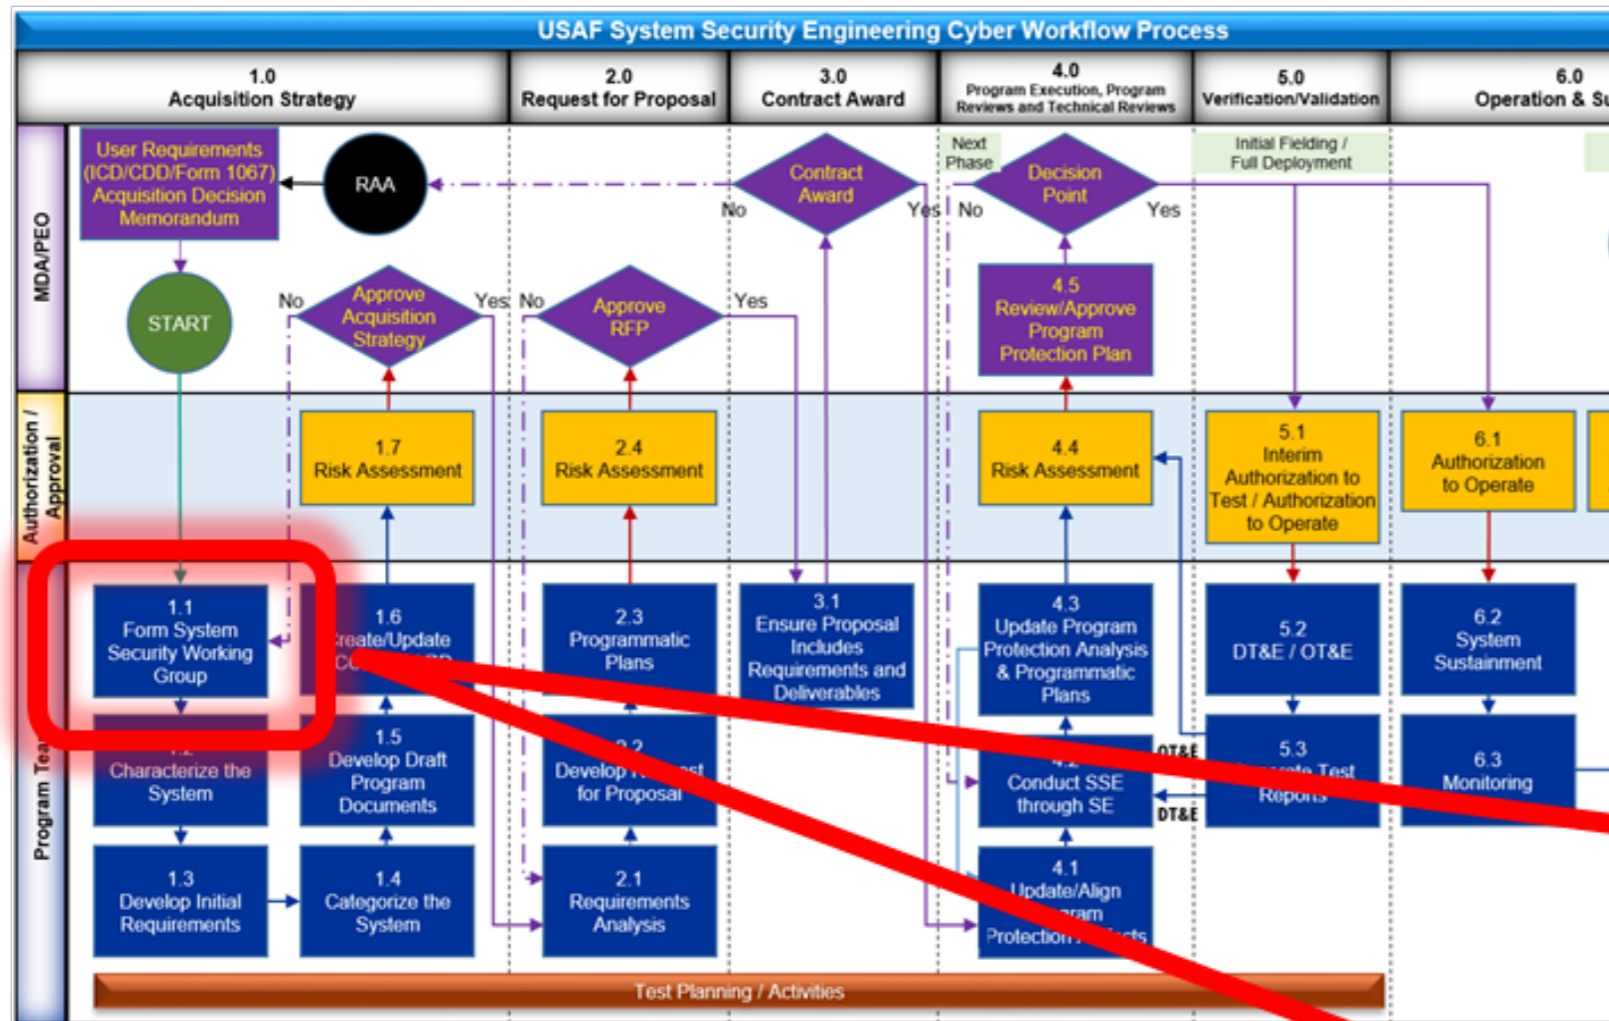

DAF SSE Cyber Workflow Process

DAF SSE Cyber Workflow Process

DAF SSE Cyber Workflow Process

The WBS provides a complete description of each activity identified in the Workflow Process

Table 4-1 Work Breakdown Structure (WBS) for the SSE Cyber Workflow Process

WBS	Activity	Description	Artifact	OPR/ Supplier	References
Requirements Approving Authority (RAA)	User Requirements	Form High Performance Team (HPT). Provide tailored Cyber Survivability Attribute (CSA) requirements per each critical weapon system function in accordance with the Cyber Survivability Implementation Guide.	• ICD/CDD/ AF Form 1067/ Acquisition Decision Memorandum	• User (MAJCOM) • Program Office • SSE	• Appendix A: USAF SSE Acquisition Guidebook (1.1 ICD, CDD) • Cyber Survivability Endorsement Implementation Guide • DoD AT Desk Reference • DoD AT Technical Implementation Guide (TIG)
1.0	Acquisition Strategy				
START	Enter DoD Acquisition Life Cycle	Upon entering the DoD Acquisition Life Cycle for any weapon system development, AF Form 1067 or new contract, begin the process laid out in the MBP.			
1.1	Form Systems Security Working Group (SSWG)				
1.1.1	Appoint Personnel to SSWG / appropriate IPT	Assemble a team to support the program's protection planning. The size and nature of the project, program, or system will dictate the size and makeup of the protection team. Ensure a lead is appointed to guide and facilitate the SSWG efforts SSWG should include personnel that can cover these functions PM, program protection lead (security management/ information protection), logistics, chief engineer, systems engineer, systems security engineer, information system security manager (ISSM), intelligence, Defense CounterNASC and Security Agency (DCSA), National Security Agency, and representatives from the Cybersecurity Working Group (CyWG), AO, TSN, USAF AT Lead, and IP. NOTE: The establishment of the CyWG is recommended within the Program Office, and as a sub-group to the Integrated Test Team (ITT). Membership should include, as a minimum, the Chief Developmental Tester (CDT) and cyber representatives from the Operational Test	• PPP Table 1.2-1	• PM	• DoDI 8510.01 • DoDI 5000.02T • DoDI 8500.01 • AFI 99-103 • AFMAN 63-119 • AFPAM 63-113 • Appendix B: USAF Combined Process Guide for CPI and CC Identification • OSD PPP Outline & Guidance

2.0 Requirements Documents

2.3 Statement of Objectives and Statement of Work

2.3.2. Program Protection

- A. The contractor shall deliver a Program Protection Implementation Plan (PPIP), CDRL 1, that is aligned to the Government developed Program Protection Plan (PPP). The contractor shall integrate the PPIP activities in the Integrated Master Plan/Integrated Master Schedule (IMP/IMS) (CDRL 10).
- B. The Contractor shall create, maintain and operate a formal incident response and forensic capability for protection of Control Unclassified Information (CUI) residing on non-federal Information Systems. The Contractor shall include the subcontractors and suppliers that perform support work that involves CUI. The scope and extent of this incident response and forensic capability shall be consistent with the assigned Contractor’s Cyber Maturity Model Certification (CMMC) level (CDRL TBD).
- C. The Contractor shall establish a System Security Plan (SSP) citing Cyber Incident Reporting (IR) requirements. Any IR that impacts a Contractor system under the contract’s DFAR clauses and provisions must be reported within 72 hours of the suspected incident. To report cyber incidents, the Contractor must have a medium assurance certificate. A review must be conducted so that the scope of the compromise can be understood. At a minimum, this review must cover the information specified in DID xx and as cited in CDRL 19 and under NIST SP800-61 Rev. 2 guidelines. As a minimum, the CDRL 19 must provide IR review reporting to include, but not limited to: Identification of affected systems; Affected Users accounts; Affected data; and Other systems that might have been compromised.(CDRL 19)
- D. The Contactor shall be prepared and report cyber incidents that result in an actual or potentially

The screenshot shows a spreadsheet with the following main sections: Requirements, Applicability Assessment, Methods of Verification, and References and Notes. The 'Requirements' section is divided into 'System Requirements' and 'Lower Level Requirements'. The 'Applicability Assessment' section has three columns: 'Subparagraph 201', 'Subparagraph 201a', and 'Subparagraph 201b'. The 'Methods of Verification' section has three columns: 'Inspection', 'Test', and 'Analysis'. The 'References and Notes' section has two columns: 'References' and 'Notes'. The spreadsheet also has a header row with 'CSA 1' through 'CSA 10' and 'Terms'. A blue arrow points from the 'SRD' box in the left panel to the 'System Requirements' column in the spreadsheet. Red boxes highlight the 'System Requirements Worksheet', 'Lower Level Requirements Worksheets', and 'Defined Terms' tabs at the bottom.

Requirements		Applicability Assessment			Methods of Verification			References and Notes	
System Requirements	Lower Level Requirements	Subparagraph 201 associated with System Critical Function (SCF) (Mission, Response, Communications, Take-off/Land)	Subparagraph 201a associated with Mission Critical Function (MCF) (Fwd)	Subparagraph 201b associated with Information Critical/Program Information CFI (Fwd)	Inspection	Test	Analysis	References	Notes
1	The system shall ensure that only authorized personnel and one person entities are allowed access to communications to the system or sub-elements within its boundaries.	101	101a	101b					
2	The system shall ensure that only authorized personnel and one person entities are allowed access to communications to the system or sub-elements within its boundaries.	102	102a	102b					
3	The system shall ensure that only authorized personnel and one person entities are allowed access to communications to the system or sub-elements within its boundaries.	103	103a	103b					
4	The system shall ensure that only authorized personnel and one person entities are allowed access to communications to the system or sub-elements within its boundaries.	104	104a	104b					
5	The system shall ensure that only authorized personnel and one person entities are allowed access to communications to the system or sub-elements within its boundaries.	105	105a	105b					
6	The system shall ensure that only authorized personnel and one person entities are allowed access to communications to the system or sub-elements within its boundaries.	106	106a	106b

DAF SSE Cyber Workflow Process

DAF SSE Cyber Workflow Process

● DAF SSECG Appendix C Summary

- Functional Thread Analysis (FTA) includes the following activities:
 - Functional Decomposition
 - Entry Access Points Identification
 - Attack Path Vignette Development
- The Functional Thread Analysis provides guidance on how to functionally decompose a system from the mission to the component level.
- The FTA is an iterative process that should be updated in conjunction with a program's Systems Engineering Technical Reviews (SETRs).
- Ultimately, the FTA and Attack Path Analysis (next slide) process will assist programs to establish informed risks.

• DAF SSECG Appendix D Summary

■ FTA (appendix C) is foundation

- Information
- Documentation
- Source Material

■ Attack Path Vignettes (APV)

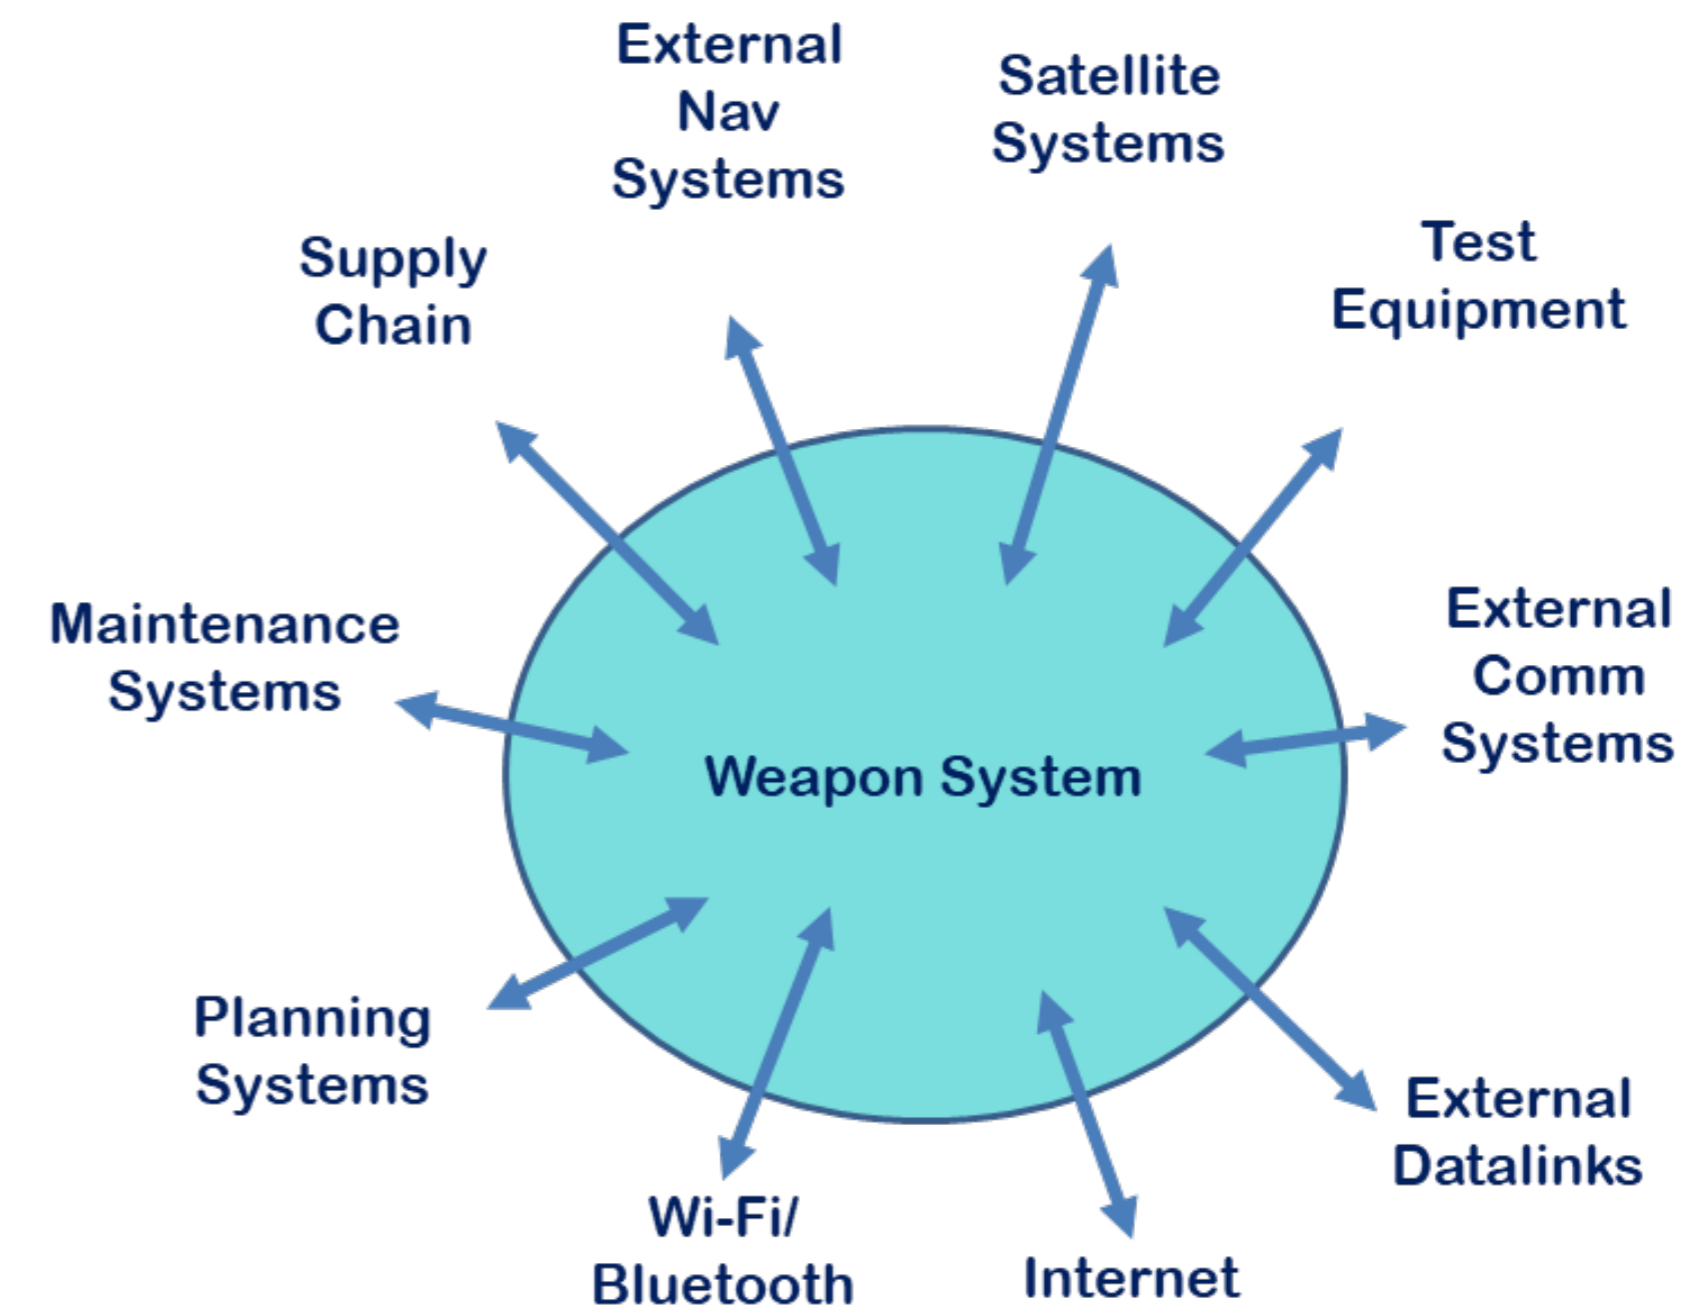

- Lexicon... the building blocks
- Generate & combine cyber vulnerabilities into cyber attack scenarios

■ Appendix D provides guidance on APA and the following:

- Attack Path Exercise (APE)

■ Primary drivers

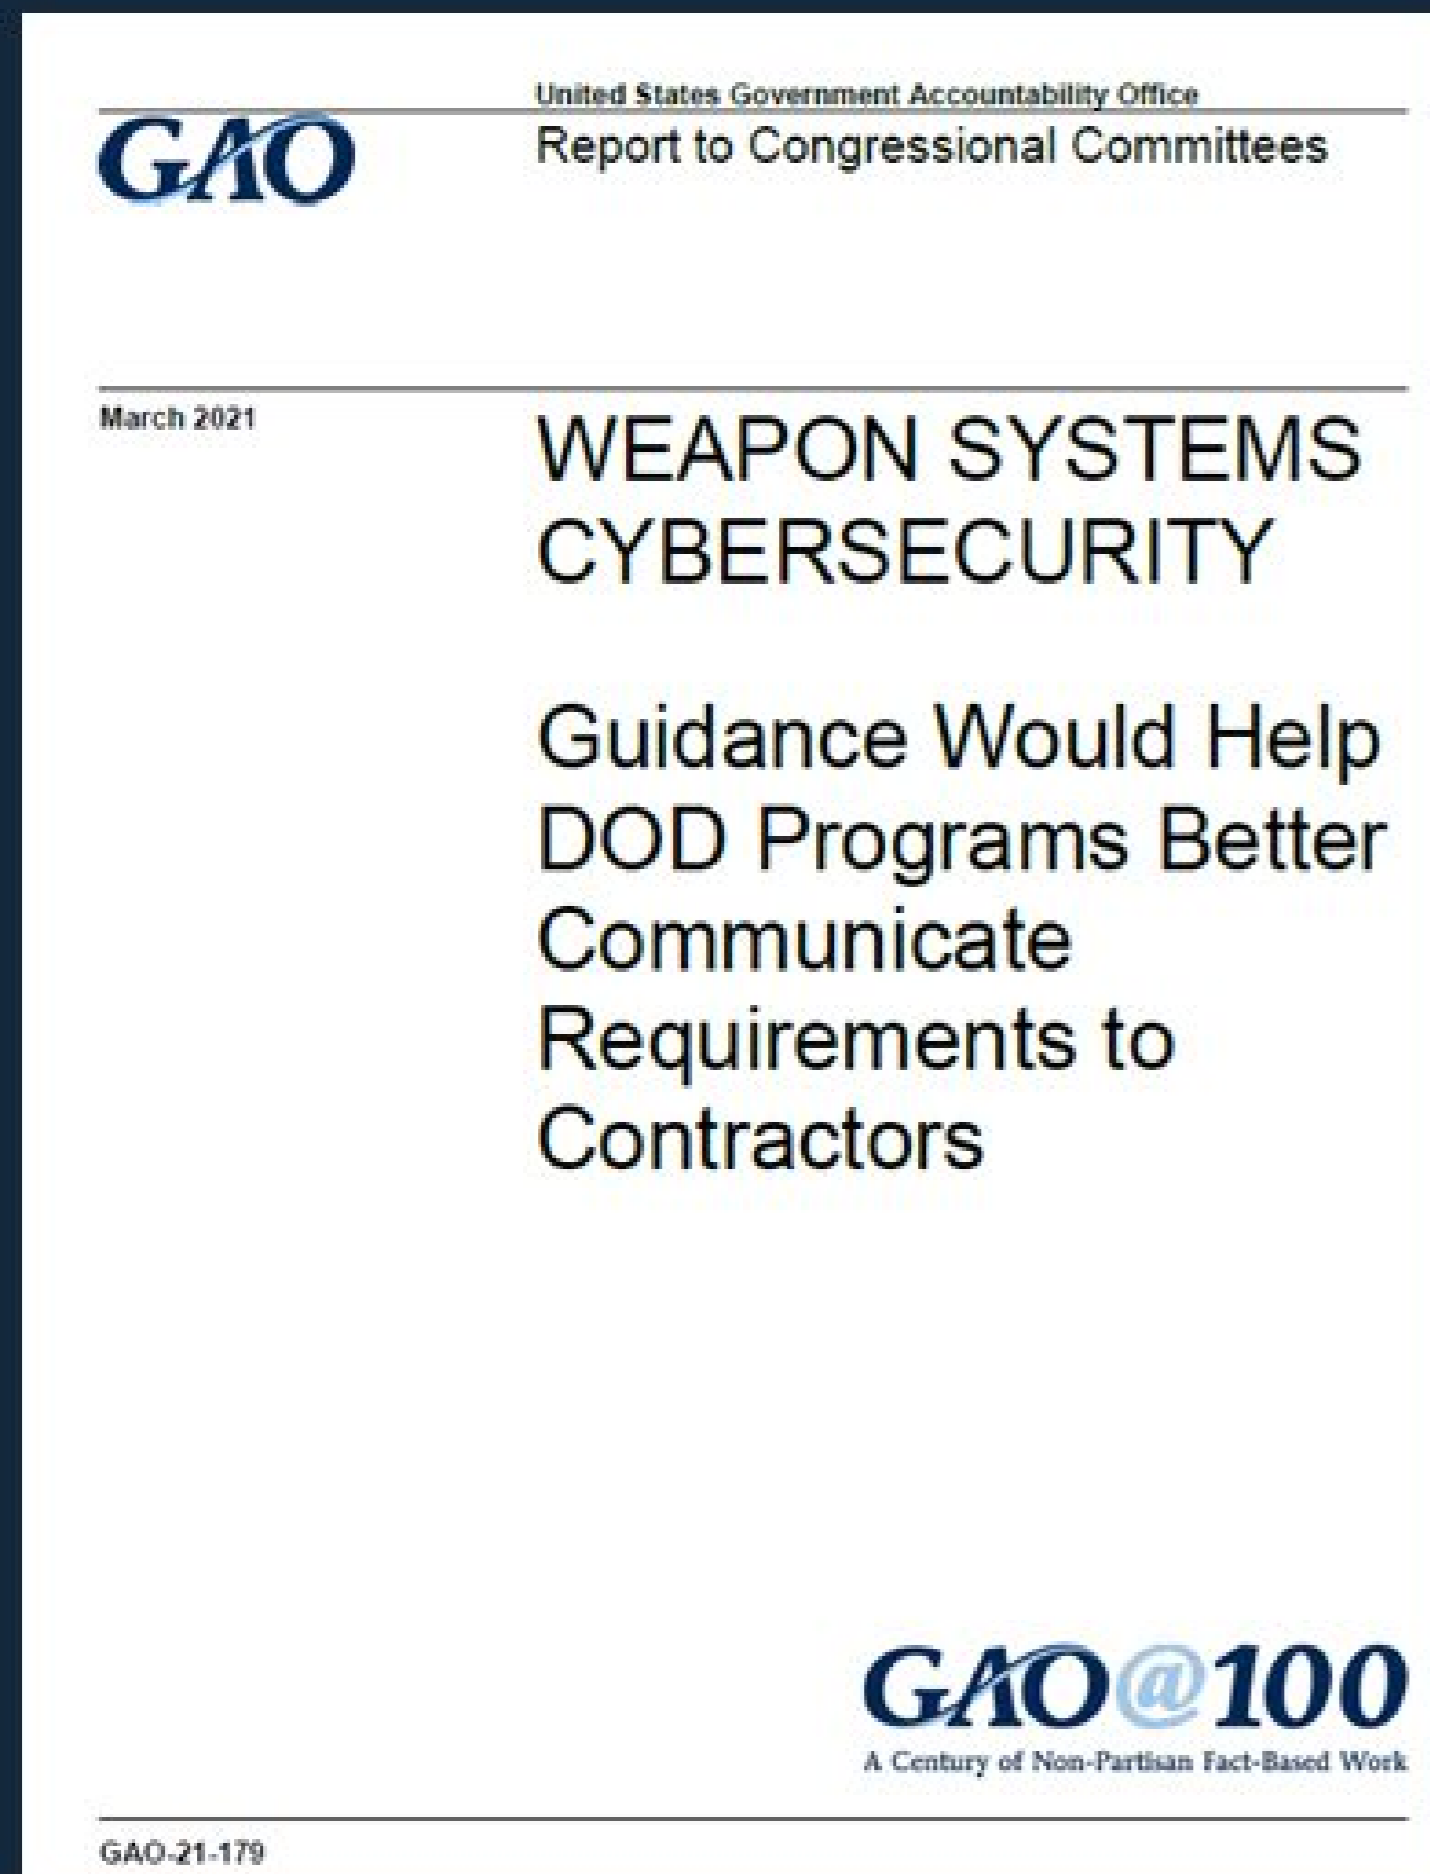

- Milestone
- SETRs

The Attack Path Analysis (APA) focuses on:

- Where the threat (e.g. attacker) can gain access?
- Which paths can be used to attack/exploit the system?
- What are the potential mission effects?

• 2021 GAO Report on Weapon Systems Cybersecurity

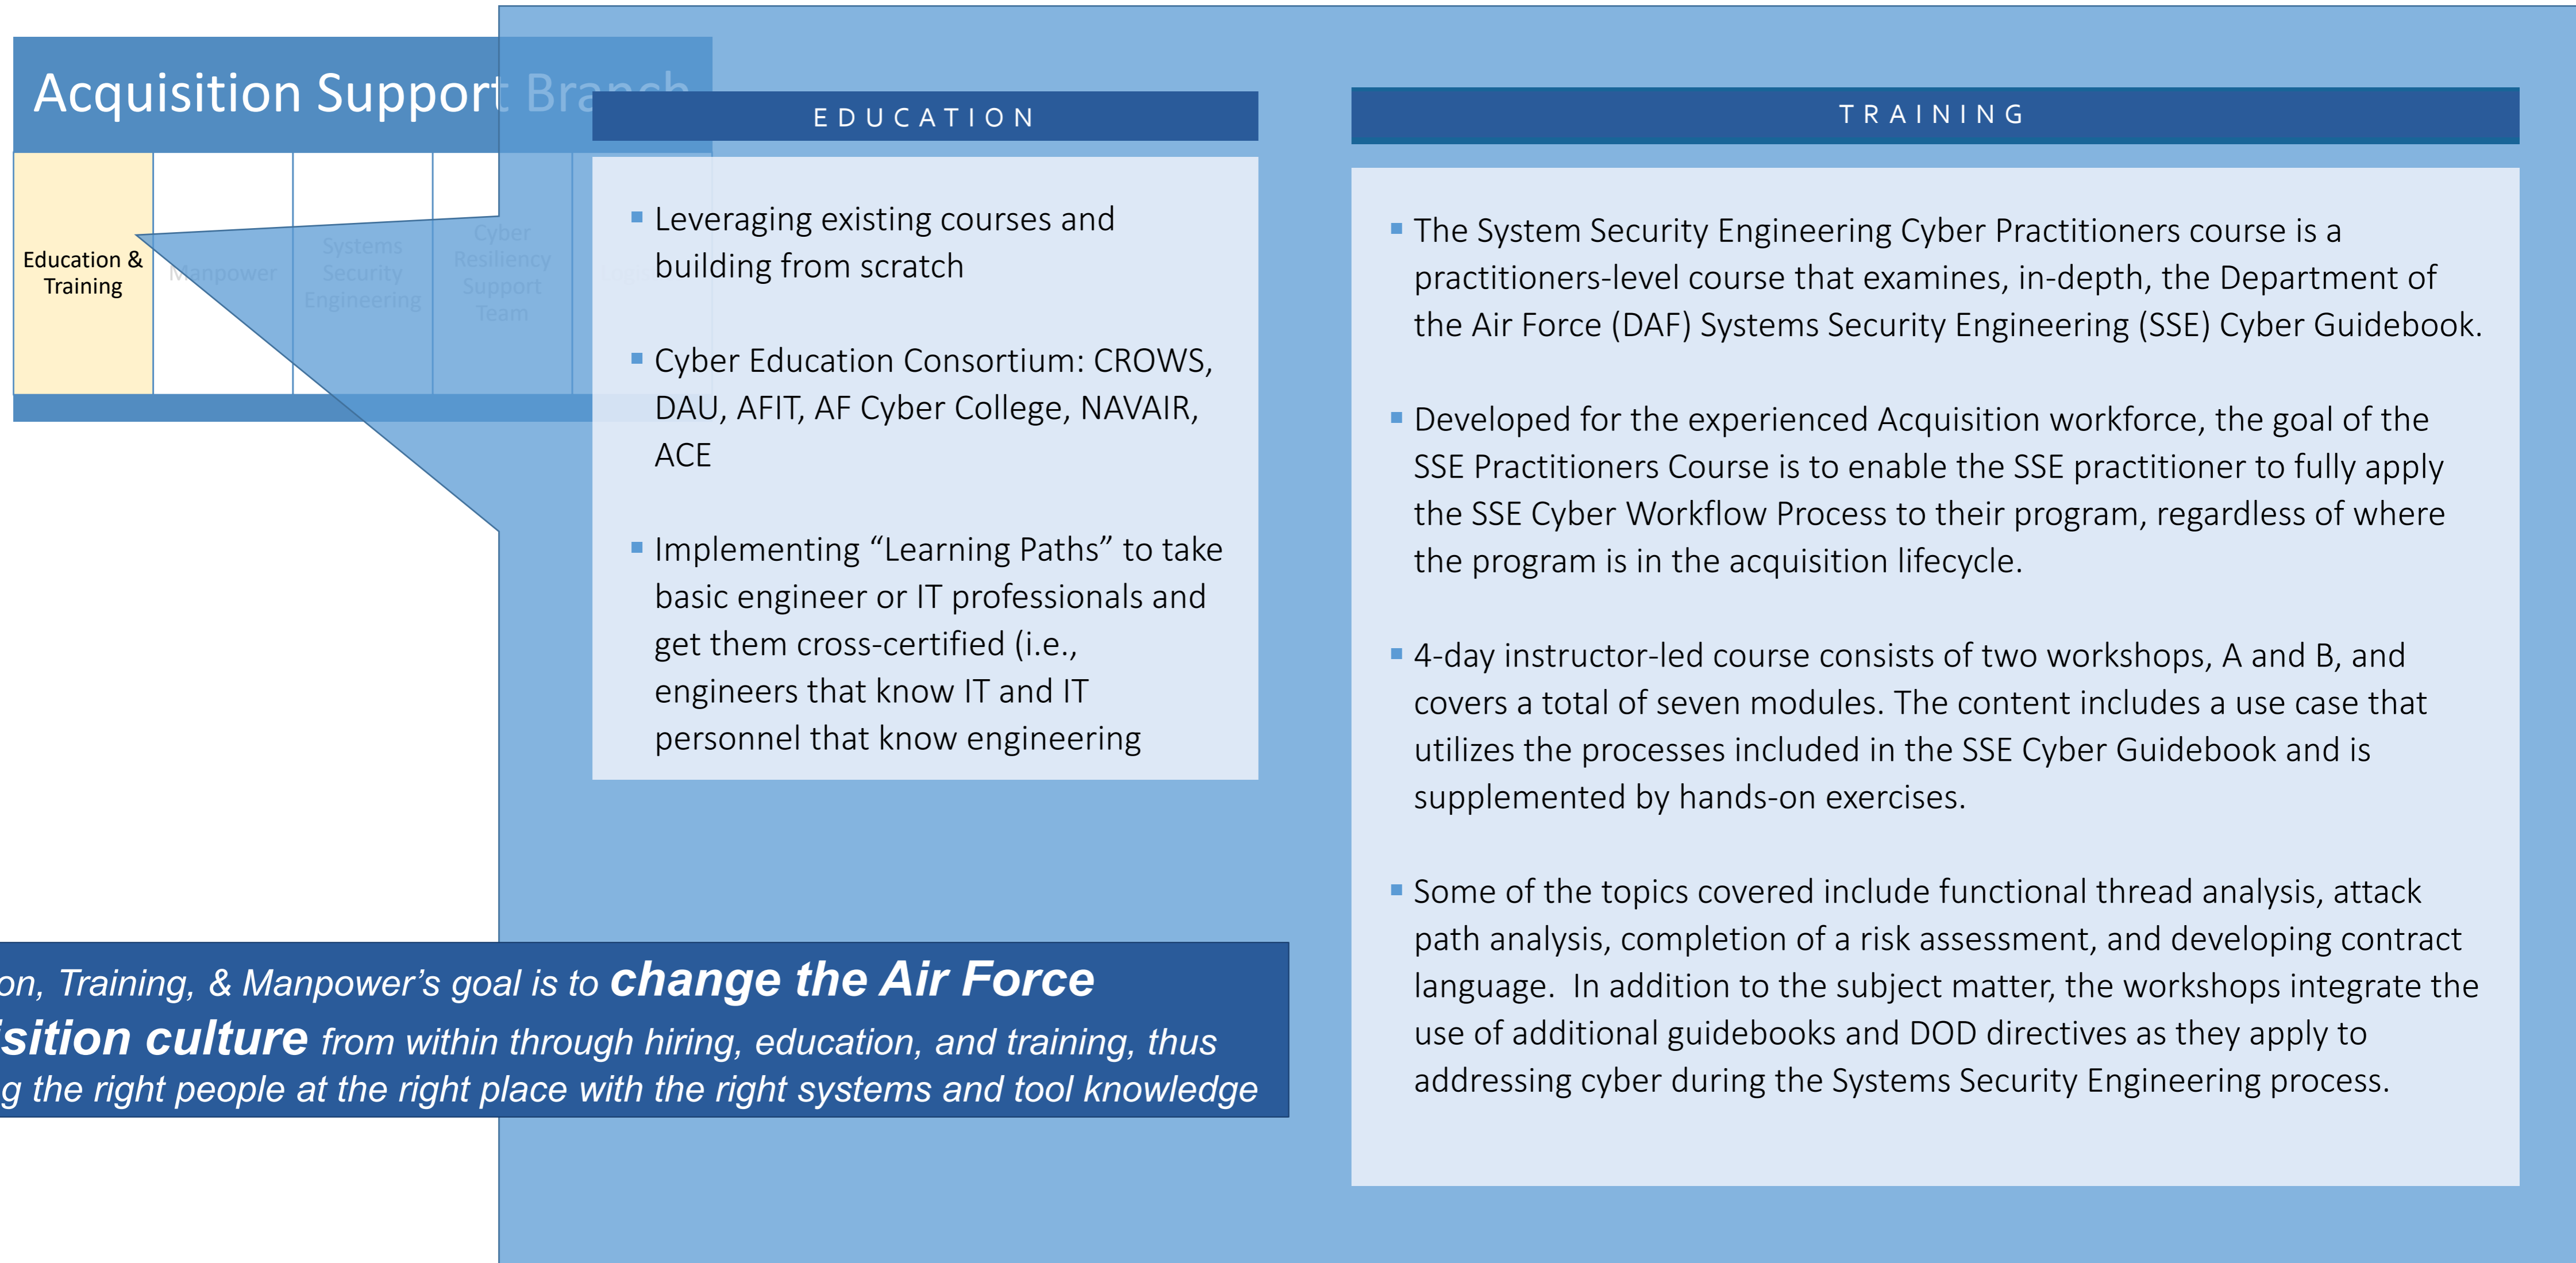

“Current military service guidance, except for the Air Force, does not address how acquisition programs should contract for weapon systems cybersecurity requirements, acceptance criteria, and verification, which DOD and program officials told GAO would be helpful.”

“The Air Force has recently issued service-wide guidance specific to contracting for cybersecurity, in part by leveraging existing departmental policies and guidance.”

“Among other things, the CROWS Guidebook provides sample language that programs could include in their requests for proposals, statements of work, and other contract documents.”

“The Air Force has taken positive actions to remedy this by developing internal guidance on how to incorporate program-specific cybersecurity requirements. The Army, Navy, and Marine Corps would benefit from a similar approach.”

● Education and Training

EDUCATION

- Leveraging existing courses and building from scratch
- Cyber Education Consortium: CROWS, DAU, AFIT, AF Cyber College, NAVAIR, ACE
- Implementing “Learning Paths” to take basic engineer or IT professionals and get them cross-certified (i.e., engineers that know IT and IT personnel that know engineering)

TRAINING

- The System Security Engineering Cyber Practitioners course is a practitioners-level course that examines, in-depth, the Department of the Air Force (DAF) Systems Security Engineering (SSE) Cyber Guidebook.
- Developed for the experienced Acquisition workforce, the goal of the SSE Practitioners Course is to enable the SSE practitioner to fully apply the SSE Cyber Workflow Process to their program, regardless of where the program is in the acquisition lifecycle.
- 4-day instructor-led course consists of two workshops, A and B, and covers a total of seven modules. The content includes a use case that utilizes the processes included in the SSE Cyber Guidebook and is supplemented by hands-on exercises.
- Some of the topics covered include functional thread analysis, attack path analysis, completion of a risk assessment, and developing contract language. In addition to the subject matter, the workshops integrate the use of additional guidebooks and DOD directives as they apply to addressing cyber during the Systems Security Engineering process.

*Education, Training, & Manpower’s goal is to **change the Air Force acquisition culture** from within through hiring, education, and training, thus providing the right people at the right place with the right systems and tool knowledge*
